

WALGENBACH

Made in Switzerland

WHY WALGENBACH?

## WHY WALGENBACH?

- Walgenbach focuses on the quality of its products. Our claim is that our love for purity and the power of nature is expressed in our products.
- This is why Walgenbach products are produced under natural conditions in our family business in western Switzerland.

# WHAT DOES ORGANIC FARMING MEAN?

- The aim of organic farming is to restore the balanced and fertile environment that normally occurs in nature, so that plants can grow and flourish healthily without the use of fertilizers, pesticides or other chemicals.
- Organic farming has been very successful in recent years because traditional farming, while it can be beneficial to farmers' yields, has been very damaging to the environment.
- Many chemical compounds (often derived from petroleum) used to kill insects, microorganisms and fungi, or to control weeds, have disturbed the balance of many areas, aquifers and animal biodiversity.
- But that's not all, certain substances are also toxic to humans, just think of the much-mentioned glyphosate.
- Growing both legal hemp and any other plant in an organic way means taking care of the soil and the whole ecosystem that keeps it in balance so that it can be used for plant development.

## WHAT JUSTIFIES THE PRICE FOR OUR PRODUCTS?

In nature, in fact, plants feed on the substances present in the soil, with insects, fungi, micro-organisms and animal excretions playing a crucial role.

Basically, organic products are those that come exclusively from organic substances and in which no artificial substances have been used.

Since the demand for CBD products is booming, this calls for many cheap suppliers on the market whose product quality and cultivation methods remain in the dark. For customers, it is often difficult to tell whether the product is of high or low quality.

With our Walgenbach products you are on the safe side and can be sure of the highest quality.

## WHAT JUSTIFIES THE PRICE OF OUR PRODUCTS?

- The production of organic CBD is extremely complex. Only unfertilized, female hemp plants may be used. Therefore, there must be no male plants in the vicinity and in all neighboring fields. On average, only a maximum of two plants per many planted weeds grow, since the plants are susceptible to slugs and erosion. No fertilizers, genetically modified seeds, growth accelerators, fungicides or pesticides may be used in our organic cultivation. We use crop rotations and thus generally have to reckon with lower yields. In addition, a lot of manual labor is still necessary to eliminate weeds and parasites.
- Walgenbach products are independently tested to ensure that they are free of harmful substances. Furthermore, all steps from cultivation to the finished product are controlled. In the end, we get a product that is as close as possible to the natural plant. The certified cultivation in Switzerland ensures that there are no heavy metals in the soil.
- Walgenbach CBD products contain neither synthetic cannabinoids nor other additives.

## WHAT JUSTIFIES THE PRICE OF OUR PRODUCTS?

Due to the vertical structure of our production, all production processes from sowing, to the supercritical CO2 extraction of the cannabinoids, as well as the filling of the containers all take place at our premises.

In order to protect the sensitive active ingredients of the CBD products in the best possible way, we fill all oils and creams into luxurious miron jars (violet glass).

As Swiss experts, we stand for uncompromising quality and unique CBD products for your maximum well-being.

# WALGENBACH

## GENTLE SUPERCRITICAL CO2 EXTRACTION

Different extraction methods enable the extraction of the valuable and sought-after CBD extract.

The decisive factor for CBD extraction is not only the method itself, but also the hemp plant used. Low-THC commercial hemp varieties enable the production of oils with a particularly high and pure CBD content.

At Walgenbach, the cannabidiol of the hemp plants is extracted using supercritical CO2 extraction: a very expensive production process that requires expert knowledge. Through this process, we achieve particularly pure extracts with high CBD concentrations.

Compared to other methods, the production by CO2-extraction is safe and non-toxic. A study shows that especially with the supercritical Co2 process, extracts with high cannabinoid concentrations are obtained.

# INNOVATION

Walgenbach stands not only for the highest product quality but also for innovation.

Besides CBD and THC, there are about 100 other cannabinoids in the hemp plant.

Most manufacturers do not have the technical prerequisites to extract these cannabinoids. We at Walgenbach are pioneers in the research of further cannabinoids.

Besides CBD, Walgenbach already offers oils with

CBG / CBC and CBN.
